① implement singly linked list with following operation.

② create a linked list

③ insertion of a node at first position at any position & at the end position

### singly linked list.

```
#include <stdio.h>
```

```
#include <stdlib.h>
```

```
struct node {
```

```
    struct node *data;
```

```
    struct node *next;
```

```
};
```

```
struct node *head = NULL;
```

```
struct node *create_node();
```

```
struct node *insert_beg();
```

```
struct node *insert_end();
```

```
struct node *insert_kth();
```

struct node \*display();

int main()  
{

int option;

while (1)  
{

printf("1. create node. 2. insert at beging.  
3. insert at end. 4. insert at xan  
5. display")

scanf("%d", &option);

switch(option)  
{

case 1: create\_node(\*head);  
break;

case 2: insert\_beg(\*head);  
break;

case 3: insert\_end(\*head);  
break;

case 4: insert\_xan(\*head);  
break;

case 5: display();  
break;

case 6: exit(0);

default: printf("wrong value");  
break;

}

}

}

```
struct node *create_node(*head)
{
```

```
    struct node * newnode, *temp;
```

```
    temp = head;
```

```
    int n;
```

```
    printf("How many data nodes you want create?");
```

```
    scanf("%d", &n);
```

```
    for(int i=1; i<n; i++)
```

```
    {
        newnode = (struct node*) malloc(sizeof(struct
                                                node));
```
